Phase unwrapping arise in many applications, such as wavefront measurements in interferometry, field mapping in magnetic resonance imaging, the interferometry SAR process, measurements in adaptive optics and even a deflectometry. Gaining attention for a long time, many algorithms have been developed in relation to phase unwrapping problem.

The phase unwrapping is performed using segment-wise, block-wise and pixel-wise phase unwrapping algorithms. The errors in phase unwrapping are shown in figures 3.17 (b)-(d), respectively. The effects of segment-wise, block-wise and pixel-wise methods of phase unwrapping are clearly visible in the error maps.

The algorithm has two main steps: 1. Phase unwrapping: we input two (or more) different frequency interferograms (of the same scene), which provides an extension of the $[-\pi, \pi]$ ambiguity interval and, consequently, an increasing of the phase rates that still allow unwrapping to be a well-posed problem.

Abstract: In the traditional processing flow of interferometric synthetic aperture radar (SAR) technique, the processing of phase is conducted via two separated and successive steps, i.e., phase denoising and phase unwrapping. That is to say, first, wrapped phases without noise are generated, and then, the true phases without 2π -ambiguities are reconstructed (here and in the rest of this paper, true phase refers to the information-induced unwrapped phase without noise).

The paper attacks absolute phase estimation with a two-step approach: the first step applies an adaptive local denoising

scheme to the modulo-2 π noisy phase; the second step applies a robust phase unwrapping algorithm to the denoised modulo-2 π phase obtained in the first step. The adaptive local modulo-2 π phase denoising is a new algorithm based on local polynomial approximations.

Phase unwrapping is thus needed to reconstruct the true phase from the wrapped phase. However, noise in a wrapped phase is an obstacle for successful phase unwrapping, especially when a simple phase unwrapping method is used [2,3], and thus denoising is necessary.

Abstract. The phase of an image obtained with many magnetic resonance imaging techniques is related to some physical variable of interest. This phase needs to be unwrapped, which is complicated by the presence of noise and multiple objects of irregular shape.
