The egg white foam will deflate and optimum volume will not be achieved. Aluminum bowls can also adversely affect egg white foam due to a chemical reaction that causes the egg whites to turn gray. Stainless steel or glass bowls are good choices for whipping egg whites. However, a copper bowl is the best choice since it releases an ion called conalbumin, which reacts with the egg white protein to form sturdy high volume foam.

### **Six Factors That Affect Egg White Foam | eHow**

Traditionally, bakers and chefs used copper bowls to stabilize egg white foams. The copper in the bowl combines with conalbumin and helps to stabilize the protein during heating. Today, a more common approach to stabilizing egg white foam is to add cream of tartar, known chemically as potassium bitartrate. This chemical salt lowers the pH of the egg white, which shortens the time necessary to form a foam.

It has long been assumed that ovomucin plays an important role in egg white foam, but the data of Forsythe and Bergquist (1951) indicated that slightly less than half of the ovomucin was retained in egg white foam. Egg white drained from foams could perform satisfactorily provided the initial foam was not too stable. They concluded that the presence of ovomucin, either in native or modified form, was not sufficient to insure satisfactory formation of egg white foam.

Other ingredients are often added to beaten egg whites, either to add flavor or to help the stability and increase volume. A pinch of salt or cream of tartar added for every 2 to 4 egg whites prior to beating will help stabilize the protein matrix and increase the volume.

### **Whipping Egg Whites: Culinary Techniques**

Considering foam's intrinsic instability along with negative effects of pasteurization process on egg white foaming ability and stability, some additives to counterbalance negative effects are required. Hydrocolloids in food industry are a group of substances which are widely used as stabilizers. Hence at the present research, Xanthan gum (XG) and Persian gum (PG) were applied as stabilizers to compensate the negative effects of pasteurization.

Foam stability experiments confirmed that egg-albumin/k-carrageenan at pH below the protein isoelectric point are the most efficient systems to stabilize air/water interfaces. These results clearly indicate that protein-polysaccharide coacervation at the air/water interface is an efficient process to increase foam stability. 1.
