Optical or photonic computing uses photons produced by lasers
or diodes for computation. For decades, photons have promised
to allow a higher bandwidth than the electrons used in
conventional computers. Most research projects focus on
replacing current computer components with optical equivalents,
resulting in an optical digital computer system processing binary
data. This approach appears to offer the best short-term
prospects for commercial optical computing, since optical

Abstract: Optical signal processing brings together various fields

of optics and signal processing - namely, nonlinear devices and
processes, analog and digital signals, and advanced data
modulation formats - to achieve high-speed signal processing
functions that can potentially operate at the line rate of fiber
optic communications. Information can be encoded in amplitude,
phase, wavelength, polarization and spatial features of an optical
wave to achieve high-capacity transmission.
