Chapter 11 Modern Atomic Theory

11. Ionization Energy
Ionization Energy: (of an atom) is the energy required to remove an electron from an individual atom in the gas phase -As we have noted, the most characteristic chemical property of a metal atom is losing electrons to nonmetals. -Another way of saying this is to say that metals have relatively low ionization energies;

Scientist believed atoms can exist on any energy levels because only certain photons (particles of light) are emitted, We know that only certain energy changes are occurring and the level the electrons are on. There are certain discrete energy level that will always emit photons (Quantized vs. Continuous) Rutherford's Atom- Electrons orbit nucleus and nucleus is made up of protons and

neutrons.

...

The modern atomic theory states that atoms of one element are the same, while atoms of different elements are different. What makes atoms of different elements different? The fundamental

characteristic that all atoms of the same element share is the number of protons. All atoms of hydrogen have one and only one proton in the nucleus; all atoms of iron have 26 protons in the nucleus.
