Abstract. The present status of the theory of itinerant electron magnetism is outlined with particular emphasis on the developments in the recent two decades, characterized by the substantial advances in the theory of spin fluctuations. The possible applicability of the itinerant electron model to the high temperature superconductor oxides and the possible importance of the effects of antiferromagnetic spin fluctuations are also discussed.

Substitution effects on weak itinerant electron ferromagnetism in Cr-based ternary alloy CrAlGe were investigated. It was found that substitution of Cr by 3 d transition metal with more electrons than Cr enhanced the spontaneous magnetization and Curie temperature. In addition, the itinerancy of CrAlGe was suppressed with the increase of electrons.

We review the spin-fluctuation theory of itinerant electron magnets with account of zero-point effects. We generalize the existing theory to account for different regimes of spin fluctuations. We show that zero-point spin fluctuations play a crucial role in both low- and high-temperature properties of metallic magnets.

At low temperatures the ultrasonic absorption and dependence of acoustic parameters on the magnetic field are defined by itinerant electrons. We have developed quasi-classical kinetic theory of electron magnetoacoustic effects in multilayers in the frameworks of the model of imperfect boundaries proposed in [2].

Abstract. The paper overviews recent investigations of thermodynamics and magnetic dynamics of itinerant electron magnets with strongly coupled (anharmonic) spin fluctuations (SF). A novel classification scheme for SF, dependent on their spatial dispersion and quantum effects is presented, including the generalized Fermi liquid (FL), soft-mode (SM), and localized moments (LM) regimes.

An important feature found in both ZF and LF time spectra is the absence of dynamic relaxation, expected for critical slowing down of spin fluctuations around T_N. Such an effect should have resulted in the 1/T¹ relaxation of the asymmetry measured in $\mu_0 H=0.01$ T, since this LF can eliminate the effect of static magnetism, while dynamic effects survive in a small LF.
