Electroconvulsive Therapy Induced Brain Plasticity

The scarce in vivo evidence for ECT-induced structural brain plasticity comes from region-of-interest (ROI) imaging studies reporting ECT-related hippocampal volume increases that correlate with clinical outcome (11, 12). Limited by an ROI approach and a lack of adequate control groups, these studies may have incompletely detected the effects of right unilateral ECT and failed to distinguish them from pharmacologically induced changes or indeed the effects of disease.

Concerns regarding structural brain damage caused by ECT have been largely attenuated because of a lack of experimental evidence for ECT-induced neuronal damage (9). Results: Both animal and human studies suggest electroconvulsive stimulation/electroconvulsive therapy (ECT)-related neuroplasticity (neurogenesis, synaptogenesis, angiogenesis, or gliogenesis). Conclusion: It remains unclear whether structural changes might explain the therapeutic efficacy and/or be related to the (transient) learning and memory impairment after ECT.

However, it seemed ECT-induced changes in brain plasticity might be unrelated to this region because no changes in GMV were observed following ECT treatment. Electroconvulsive therapy and structural neuroplasticity ...

Electroconvulsive therapy (ECT)—the induction of convulsive seizures via epicranial electrodes placed unilaterally or bilaterally—is one of the most effective treatment strategies for MDD, showing superior efficacy compared with antidepressant medication in numerous studies. 8 One of the main indications for ECT is treatment-resistant depression, in which it can reach remission rates of up to 50%. 9 In addition, as its onset of action is much faster than for conventional antidepressants ...

Effect of electroconvulsive therapy on hippocampal and ...

The effects of ECT on amygdala and hippocampus volume suggest that ECT-induced brain gray matter structure neuroplasticity relates to improved clinical response [6-9]. We considered the anatomical basis connecting them, rather than alone, because the hippocampus connects with the amygdala and the limbic hypothalamic-pituitary-adrenal (HPA) axis, which are central to the pathophysiology of the MDD [9 , 40].

Although recent reports advocated that such ECT-induced structural changes could result from neurogenesis induction in neurogenic regions (that is,

dentate gyrus 13), the extension of volume increases to other hippocampal subfields and limbic regions 14 suggests that they are likely better understood as resulting from more general structural neuroplastic changes, which embrace different molecular mechanisms in addition to neurogenesis, such as synaptogenesis, gliogenesis or angiogenesis. 15 ...
