Parametric Empirical Bayes Methods For
 Empirical Bayes methods are procedures for statistical inference in which the prior distribution is estimated from the data. This approach stands in contrast to standard Bayesian methods, for which the prior distribution is fixed before any data are observed. Despite this difference in perspective, empirical Bayes may be viewed

as an approximation to a fully Bayesian treatment of a hierarchical model wherein the parameters at the highest level of the hierarchy are set to their most likely values

The idea with empirical Bayesian methods is to use the Bayesian setup but to estimate the priors from the population of all features. Formally speaking, empirical Bayes are frequentist methods which produce p-values and

confidence intervals. However, because we have the empirical priors, we can also use some of the probabilistic ideas from Bayesian analysis. We will be using empirical Bayes methods for differential expression analysis. Moderated Methods

Empirical Bayes methods are a collection of ways to estimate and update the parameters of a prior probability before creating a posterior probability distribution. This technique still follows the general Bayesian statistics model, but turns the process of estimating initial assumptions (prior probability) into a two-step procedure. Empirical Bayes estimation is used instead of the Maximum Entropy Principle when more than one parameter is known, but still not enough is known to create a ...
