In the first activity students work in groups to determine the density of tap water and of tap water with salt, then compare the densities. The second activity investigates the role of temperature and salinity in determining seawater density. Students use a Temperature-Salinity (T-S) Diagram to examine the effect of mixing on density.

Seawater density is illustrated in the diagram by curved lines of constant density. Surface waters are mixed by winds and deep ocean water mixing is driven by density differences. Circulation in the depths of the ocean is referred to as thermohaline circulation.

Density: Sea Water Mixing and Sinking

Cold, salty water is denser than warm, fresher water and will sink below the less dense layer. Density is defined as the measure of a material's mass (e.g. grams) divided by its volume (e.g. milliliters). , Mixing of seawater influences the density of seawater thereby affecting ocean circulation. Seawater midng also has an affect on ocean life.

Density is defined as the measure of a material's mass (e.g. grams) divided by its volume (e.g. milliliters). , Mixing of seawater influences the density of seawater thereby affecting ocean circulation. Seawater midng also has an affect on ocean life. Essential Questions: o Can oceans be too salty, or not salty enough? o What is a pattern? Is ocean salinity a pattern?

Density: Sea Water Mixing and Sinking

Seawater density is illustrated in the diagram by curved lines of constant density. Surface waters are mixed by winds and deep ocean water mixing is driven by density differences. Circulation in the depths of the ocean is referred to as thermohaline circulation. The deep ocean is layered with the densest water on bottom and the least dense water on top. Water tends to move horizontally throughout the deep ocean, moving along lines of equal density.

Density of Sea W ater T-S Diagrams

The density of a material is given in units of mass per unit volume and expressed in kilograms per cubic metre in the SI system of units. In oceanography the density of seawater has been expressed historically in grams per cubic centimetre. The density of seawater is a function of temperature, salinity, and pressure.

It does so by using a Temperature-Salinity (T-S) Diagram to examine the effect of mixing on density. Such mixing can be a significant factor in causing surface seawater to sink as part of vertical circulation. The T-S Diagram is a simple but powerful tool used in studies of seawater density, mixing, and circulation.

Dissolved salts increase the density of water and depress both the temperature of maximum density and the freezing point. The oceans dominate the hydrological cycle. The cycle is affected by two factors: water in the atmosphere and the ice in the oceans. The most obvious manifestations of water in the atmosphere are clouds and fog.

Seawater, or salt water, is water from a sea or ocean.On average, seawater in the world's oceans has a salinity of about 3.5% (35 g/l, 599 mM). This means that every kilogram (roughly one liter by volume) of seawater has approximately 35 grams (1.2 oz) of dissolved salts (predominantly sodium (Na +) and chloride (Cl –) ions).Average density at the surface is 1.025 kg/l.

Seawater - Wikipedia

The ocean has three main layers: the surface ocean, which is generally warm, and the deep ocean, which is colder and more dense than the surface ocean, and the seafloor sediments. The thermocline separates the surface from the deep ocean. Due to density differences, the surface and deep ocean layers do not easily mix.

Ocean Layers & Mixing - Time Scavengers

The potential density of a fluid parcel at pressure is the density that the parcel would acquire if adiabatically brought to a reference pressure , often 1 bar (100 kPa).Whereas density changes with changing pressure, potential density of a fluid parcel is conserved as the pressure experienced by the parcel changes (provided no mixing with other parcels or net heat flux occurs).

Potential density - Wikipedia

Seawater intrusion is mainly due to tides and to the influence of the density difference between seawater and river water on currents and turbulence (this influence is often termed 'buoyancy effects', see the article Estuarine circulation for further details). It is counteracted by fresh water inflow from rivers, groundwater and other sources.

Seawater intrusion and mixing in estuaries - Coastal Wiki

As the water in the epilimnion cools, the density difference between the epilimnion and hypolimnion is not as great. Wind can then mix the layers. In addition, when the epilimnion cools it becomes more dense and sinks to the hypolimnion, mixing the layers. This mixing allows oxygen and nutrients to be distributed across the whole water column.

Ocean water, because it contains a mixture of salts and dissolved particles averages a specific density between 1.020 to 1.029. Density in ocean water is measured using a hydrometer, which is a glass tube with a standard weight attached to a scale that indicates how far the weight sinks in the fluid.

Thermohaline circulation (THC) is a part of the large-scale ocean circulation that is driven by global density gradients created by surface heat and freshwater fluxes. The adjective thermohaline derives from thermo-referring to temperature and -haline referring to salt content, factors which together determine the density of sea water. Wind-driven surface currents (such as the Gulf Stream ...
