2. Gas atomization:
Here instead of water,
high velocity argon,
nitrogen and helium
gas jets are used. The

molten metal is disintegrated and collected as atomized powder in a water bath. Fluidized bed cooling is used when certain powder characteristics are required. 3. Vacuum atomization: In this method, when a molten metal supersaturated with a gas

Atomization(Powder Production) - Askmemetallurgy

Atomization, also called the spraying method, is a process in which molten metals are broken into small drops of liquid by high-speed fluids (gas as air or inert gas; liquid as water) or fluids with centrifugal force, and then solidified into powder. The schematic diagram for the spraying process is

shown in Figure 2.1 [7].
