Estimating the pose of an unmanned aerial vehicle (UAV) or drone is a challenging task. It is useful for many applications such as navigation, surveillance, tracking objects on the ground, and 3D reconstruction. In this work, we present a LiDAR-camera-based relative pose estimation method between a drone and a ground vehicle, using a LiDAR sensor and a fisheye camera on the vehicle's roof and ...

In this study, we use superpixel segmentation to classify the fish-eye image into the sky area and obstacles. Further, a sample of the most probable visible satellite extraction is developed to robustly detect the N-LOS satellites to estimate the location of a vehicle in urban environments. We also propose a technique to estimate the camera orientation rate from sequential fish-eye images, which is required for projecting the position of the satellite onto the fish-eye image.
