Sea-Floor Spreading Answer Key. This is a mid-ocean ridge. It is an underwater mountain range that forms when magma pushes up on the crust at a divergent boundary. Seafloor spreading is happening at B. Molten rock pushes up from the asthenosphere and pushes the plates apart at the mid-ocean ridge. This

creates new ocean crust.

Lab Investigation-4. Now fold the second sheet of paper in half crosswise. Starting at the center fold, draw lines 5.5 cm long on the middle crease and the two creases closest to the ends of the paper. Carefully cut along the lines you drew. Unfold the paper. There should be three slits, each 11 cm long, in the center of the paper as shown below. 5.

Sea-Floor Spreading Flashcards | Quizlet

Seafloor spreading, theory that oceanic crust forms along submarine mountain zones, known collectively as the mid-ocean ridge system, and spreads out laterally away from them. This idea played a pivotal role in the development of the theory of plate tectonics, which revolutionized geologic thought during the last quarter of the 20th century.

seafloor spreading | Evidence & Process | Britannica

The mid-ocean ridge is where the seafloor spreading occurs, in which

tectonic plates—large slabs of Earth's lithosphere—split apart from each other. Seafloor spreading was proposed by an American geophysicist, Harry H. Hess in 1960. By the use of the sonar, Hess was able to map the ocean floor and discovered the mid-Atlantic ridge (mid-ocean ridge). He also found out that the temperature near to the mid-Atlantic ridge was warmer than the surface away from it.
