Summary. This chapter explores transfer functions by first defining what a linear system is and how time constants shape the response of the analyzed circuit. A system is said to be linear if it satisfies the superposition principle. The chapter discusses linear systems and time constants, explaining the principle of low-entropy expressions, and the features of a linear time-invariant (LTI) system.

Transfer Functions. The ratio of the output and input amplitudes for Figure 2, known as the transfer function or the frequency response, is given by. Implicit in using the transfer function is that the input is a complex exponential, and the output is also a complex exponential having the same frequency. The transfer function reveals how the circuit modifies the input amplitude in creating the

output amplitude.
