Textile reinforced concrete (TRC) is a promising material for the construction of thin concrete shells due to its strength, geometric versatility, and durability. Existing design methods for TRC shells predicts the local capacity by linear interpolation between experimentally determined values of strength in pure tension, pure bending, and pure compression.

A concrete shell, also

commonly called thin shell concrete structure, is a structure composed of a relatively thin shell of concrete, usually with no interior columns or exterior buttresses. The shells are most commonly flat plates and domes, but may also take the form of ellipsoids or cylindrical sections, or some combination thereof. The first concrete shell dates back to the 2nd century.

Thin concrete cylindrical shells can cover the roofs of various buildings efficiently and aesthetically. Large roof spans of bus, railroad, and air

terminals, sport stadia, and aircraft hangars have been effectively covered with reinforced concrete shells, many of which have been cylindrical. Cylindrical shell forms can be easily shored and easily reinforced.
