Physclips. Differential equations involve the differential of a quantity: how rapidly that quantity changes with respect to change in another. For instance, an ordinary differential equation in $x(t)$ might involve x , t , dx/dt , d^2x/dt^2 and perhaps other derivatives. We'll look at two simple examples of ordinary differential equations below, solve them in two different ways, and show that there is nothing frightening about them – well at least not about the easy ones that you'll meet in ...

Differential Equations: some simple examples from Physclips

In mathematics, a differential equation is an equation that relates one or more functions and their derivatives. In applications, the functions generally represent physical quantities, the derivatives represent their rates of change, and the differential equation defines a relationship between the two. Such relations are common; therefore, differential equations play a prominent role in many disciplines including engineering, physics, economics, and biology. Mainly the study of differential equations

Ordinary and partial differential equations appear in physics as equations of motion or of state. They are often linear differential equations for which a

sum of solutions remains a solution. The solution of first- and second-order linear differential equations are obtained. The specification of linearly independent solutions using suitable boundary/initial conditions is discussed.

Differential equations solving with Maxima. Let's see each lines in details. The first two inputs are the given differential equations written as $f(x, y) =$

0. In the third input, we create a list with all the equations, where we will add the two new definitions of $u(t)$ and $v(t)$ later. In the fourth and sixth, we define the $u(t)$ and $v(t)$ as the derivatives of the functions $x(t)$ and $y(t)$ respectively.

A Differential Equation is a n equation with a function and one or more of its derivatives: Example: an equation with the function y and its derivative dy/dx . Solving. We solve it when we discover

Degree of Differential Equation. The degree of the differential equation is the power of the highest order derivative, where the original equation is represented in the form of a polynomial equation in derivatives such as y', y'', y''' , and so on.. Suppose $(d^2 y/dx^2) + 2(dy/dx) + y = 0$ is a differential equation, so the degree of this equation here is 1.

Description. Waves exist widely in various fields of physics, such as fluids, plasmas, acoustics, optics, or electromagnetism. These phenomena can usually be described by differential equations and the corresponding solving
