The differences between engines is their optimisations and thus designs. Turbojet engines are optimised to maximum exhaust thrust and minimum torque securing optimal work of the engine. Turboprop, Turbofan and other Turbo- engines are optimised to produce maximum torque on the shaft and the exhaust thrust is of lesser interest here. The propeller then produces the main thrust of the whole engine.

Difference Between Turbojet and

Turbofan | Compare the ...

In a turbine engine, air is compressed and then fuel is ignited in this compressed air. The energy produced by the ignition turns the turbine. The turbine is then able to drive both the compressor at the front of the engine and also some useful load. In airplanes, it produces thrust. The first jet engine was a turbojet. This is a simple turbine engine that produces all of its thrust from the exhaust from the turbine section.

or g/(s·kN) (grams of fuel per second-kilonewton). Mass of fuel is used, rather than volume (gallons or litres) for the fuel measure, since it is independent of temperature.
