Use the formula for torque, where F is the force exerted, r is the distance from the center of rotation to the point where the force is exerted, and θ is the angle between the two vectors. In this problem, the string is the pivot arm, so $r = 2.8$ meters. The force exerted on it at the point of contact with the pendulum is the force of gravity on the pendulum: the weight of the pendulum.

Torque in Physics Problems - dummies

When studying how objects rotate, it quickly becomes necessary to figure out how a given force results in a change in the rotational motion. The tendency of a force to cause or change rotational motion is called torque, and it's one of the most important concepts to understand in resolving rotational motion

situations.

Torque the axle nut to specs. Clean the inside of the rotor, where the hub meets it, so it sits flat against the new hub. Install the rotor, caliper assy. Install the wheel and torque the lug nuts to 100 ft pounds. Road test about 5 miles and recheck the lug nuts.

SOLVED: I need torque specs for - Fixya

Multiply the moment of inertia by the angular acceleration to find the torque. The full formula for torque using the moment of inertia and the angular acceleration is $\tau = I\alpha$, where " τ " stands for torque, " I " stands for the moment of inertia, and " α " stands for the angular acceleration. If you're trying to find torque, simply

multiply the moment of inertia and the angular acceleration to get your result.
