Crashworthiness is the ability of a structure to protect its occupants during an impact. This is commonly tested when investigating the safety of aircraft and vehicles. Depending on the nature of the impact and the vehicle involved, different criteria are used to determine the crashworthiness of the structure. Crashworthiness may be assessed either prospectively, using computer models or experiments, or retrospectively by analyzing crash outcomes. Several criteria are used to assess crashworthin

Upon crashing, the majority of helicopters will sink rapidly, filling with water, debris, and fuel (Ryack, Luria, & Smith, 1986). Further, many helicopters become unstable upon contact with the water and will invert, leaving survivors strapped in their seats, upside down, and underwater (Taber & McCabe, 2009).

Helicopter Structure - an overview | ScienceDirect Topics

According to the helicopter crash accident analysis, injury to the occupants during a helicopter crash comes principally from three aspects: (a) the inertial overload imposed on the occupants by sudden acceleration; (b) the contact injury caused by the collision between the occupants and hard surfaces in the cabin; (c) the environmental injury such as the fire caused by fuel leakage, the asphyxiation caused by smoke and fume and the drowning caused by water.
