Genetic Engineering Of Mammalian Cells

Genetic engineering in mammalian cells calls for additional steps. Ways must be found to introduce the desired gene, purified and amplified by cloning in bacteria, into a mammalian cell. Then ways must be found to express the gene: to get the DNA of the gene transcribed into messenger RNA and to get the messenger RNA translated into protein.

Genetic Engineering in Mammalian Cells

Various genetic tools that allow precise DNA modifications have been developed to achieve loss- and gain-of-function strategies in mammalian cells. DNA recombination by site specific recombinases (SSR) like Cre or FLP developed into an extremely valuable approach to manipulate the genome of a wide variety of cells.
