Answers to Optimization Problems Practice 1) p = the profit per day x = the number of items manufactured per day Function to maximize: $p = x(110 - 0.05x) - (50x + 6000)$ where $0 \leq x < \infty$ Optimal number of smartphones to manufacture per day: 600 2) A = the total area of the two corrals x = the length of the non-adjacent sides of each corral

Optimization Problems Practice

$p = 6.67$, or 20. Because we got two answers, we have to check which one (if any) gives the correct result. Plugging in each one into the revenue function, we find: $R(6.67) = 400(6.67) - 40(6.67)^2 + (6.67)^3 = 1185.18$. $R(20) = 400(20) - 40(20)^2 + (20)^3 = 0$. Clearly $p = 6.67$ gives better revenue.

To solve an optimization problem, begin by drawing a picture and introducing variables. Find an equation relating the variables. Find a function of one variable to describe the quantity that is to be minimized or maximized. Look for

critical points to locate local extrema.

4.7 Applied Optimization Problems - Calculus Volume 1

(Note: This is a typical optimization problem in AP calculus). Step 1: Determine the function that you need to optimize. In the example problem, we need to optimize the area A of a rectangle, which is the product of its length L and width W . Our function in this example is: $A = LW$. Step 2: Identify the constraints to the optimization problem. In our example problem, the perimeter of the rectangle must be 100 meters.

Optimization problems

are problems of identifying certain extrema, and tend to involve not just finding them (which would be just looking at the first derivative of the parent function for zeros, which correspond to possible critical points/extrema) but also describing the parent function in the first place, determining it from a worded description of the problem.

Optimization: sum of squares (video) | Khan Academy

In this section we are going to look at optimization problems. In optimization problems we are looking for the largest value or the smallest value that a function can take. We saw how to solve one kind of optimization problem

in the Absolute Extrema section where we found the largest and smallest value that a function would take on an interval.
