Enzymes Biological Catalysts Sinica

Enzymes are biological catalysts that speed up the rate of the majority of chemical reactions that occur in the cell. They do this by lowering the activation energy required for the reaction to proceed. Enzymes are essential, the rate of most reactions would be too slow without them and the cell would fail to keep up with the biochemical demands. Enzymes have an important structural feature called the active site which is the location of the chemical reactions.

Catalyst and enzyme are two substances that increase the rate of a reaction without being changed by the reaction. There are two types of catalysts as enzymes and inorganic catalysts. Enzymes are a type of biological catalysts. The main difference between catalyst and enzyme is that catalyst is a substance that increases the rate of a chemical reaction whereas enzyme is a globular protein that can increase the rate of biochemical reactions.

Difference Between Catalyst and Enzyme | Definition ...

Enzymes Enzymes are catalysts that drive reaction rates forward. Most catalysts, but not all, are made up of amino acid chains called proteins that accelerate the rate of reactions in chemical systems. The functionality of a catalyst depends on how the proteins are folded, what they bind to, and what they react with.
