### The Periodontium Alveolar Process Cementum

This chapter discusses the hard tissues of the periodontium, which are cementum and alveolar bone. The alveolar process is the bony part of the maxilla and mandible that has the primary function of supporting the teeth. Alveolar bone is composed of alveolar bone proper, which is attached to the fibers embedded in the roots of the teeth.

### chapter 14: periodontium: cementum, alveolar process, and ...

The periodontium consists of cementum, alveolar process of the maxillae and mandible, periodontal ligament, and gingiva. CEMENTUM Cementum is the only tissue considered as both a basic part of the tooth and a component of the periodontium.

### PERIODONTIUM

The alveolar process contains a region of compact bone (called the lamina dura) which is attached to the cementum of the roots by the periodontal ligaments. Like any other bone in the human body, alveolar bone is modified throughout life; under the effect of various external factors, it may suffer processes of bone resorption or bone formation .

### Periodontium or the tooth supporting structure

D The alveolar bone proper makes up the lining of the tooth socket or alveolus. Although the alveolar bone proper is composed of compact bone, it may be called the cribriform plate because it contains numerous holes where Volkmann canals with their nerves and blood vessels pass from the alveolar process into the periodontal ligament. The lamina propria is the connective tissue component of the oral mucosa. A mucoperiosteum is a combined structure consisting of a mucous membrane, in the case of ...

#### **Ch.14 - Periodontum: Cementum, Alveolar Process ...**

Cementum similarly adapts to wear on the occlusal surfaces of the teeth by apical deposition. The periodontal ligament in itself is an area of high turnover that allows the tooth not only to be suspended in the alveolar bone but also to respond to the forces.

#### **Periodontium - Wikipedia**

Concurrently, other mesenchymal cells in the dental follicle differentiate into fibroblasts, forming the periodontal ligament (PDL), and still other mesenchymal cells differentiate into osteoblasts adjacent to the bone, forming the sockets within the alveolar process. This relationship between cementum deposition, connective tissue fiber formation, and bone deposition facilitates the embedding of PDL fibers into the cementum of the tooth and the alveolar bone proper.
