Brine solution mining. Natural brine wells are the source of a large percentage of the world's bromine, lithium, and boron and lesser amounts of potash, trona (sodium carbonate), Glauber's salt (sodium sulfate), and magnesium. In addition, artificial brines are produced by dissolving formations containing soluble minerals such as halite (rock salt; sodium chloride), potash, trona, and boron.

In-situ leaching, also called in-situ recovery or solution mining, is a mining process used to recover minerals such as copper and uranium through boreholes drilled into a deposit, in situ. In situ leach works by artificially dissolving minerals occurring naturally in a solid state. For recovery of material occurring naturally in solution, see: Brine mining. The process initially involves the drilling of holes into the ore deposit. Explosive or hydraulic fracturing may be used to create open pat
