Genetic Algorithms And Genetic Programming

The Genetic Algorithm (GA) is a probabilistic search algorithm that iteratively transforms a set (population) of objects (usually a fixed-length binary string), each with an associated fitness value, into a new population of offspring objects using the Darwinian principle of natural selection and operations that mimic naturally occurring genetic operations, such as sexual recombination (crossover) and mutation.

In artificial intelligence, genetic programming is a technique of evolving programs, starting from a population of unfit programs, fit for a particular task by applying operations analogous to natural genetic processes to the population of programs. It is essentially a heuristic search technique often described as 'hill climbing', i.e. searching for an optimal or at least suitable program among the space of all programs. The operations are: selection of the fittest programs for reproduction and
