### Plant Structure And Growth

This BioCoach activity can help you review the basic structure and growth of flowering plants (angiosperms). Dicotrs are emphasized throughout, but monocots are mentioned for comparison. After reviewing the cells and tissues that make up a flowering plant, you will explore the growth and structure of the three vegetative organs of a plant: the root, stem, and leaf.

They grow through a combination of cell growth and cell division (mitosis). The key to plant growth is meristem, a type of plant tissue consisting of undifferentiated cells that can continue to divide and differentiate. Meristem allows plant stems and roots to grow longer (primary growth) and wider (secondary growth).

Primary growth produces the primary plant body, the parts of the root and shoot systems produced by apical meristems. An herbaceous plant and the youngest parts of a woody plant represent the primary plant body. Apical meristems lengthen both roots and shoots. However, there are important differences in the primary growth of these two systems.

### Chapter 35 - Plant Structure | CourseNotes

The tip (terminal bud) of the main stem has a specialized structure that is the source of new growth for plants. You will find the apical meristem that

develops into young leaves (primodium). There are other points of growth at each node where leaves and branches develop on the stems.

Plant Cell Structures. Structures found in plant cells but not animal cells include a large central vacuole, cell wall, and plastids such as chloroplasts. The large central vacuole is surrounded by its own membrane and contains water and dissolved substances. Its primary role is to maintain pressure against the inside of the cell wall, giving the cell shape and helping to support the plant.

Important structures in plant development are buds, shoots, roots, leaves, and flowers; plants produce these tissues and structures throughout their

life from meristems located at the tips of organs, or between mature tissues. Thus, a living plant always has embryonic tissues. By contrast, an animal embryo will very early produce all of the body parts that it will ever have in its life. When the animal is born, it has all its body parts and from that point will only grow larger and more mature.
