Mitigating greenhouse gas emissions. Video: The funding area "Mitigating greenhouse gas emissions" in a nutshell. A limitation of global warming to well below 2°C or even below 1.5°C requires a fundamental restructuring of important areas in the economy and society. This includes the use of renewable energies, increasing energy efficiency, reducing extremely climate-

damaging fluorinated greenhouse gases (F-gases) as well as sustainable mobility and city planning.

Climate change mitigation consists of actions to limit the magnitude or rate of global warming and its related effects. This generally involves reductions in human emissions of greenhouse gases (GHGs).. Fossil fuels account for about 70% of GHG emissions. The main challenge is to eliminate the use of coal, oil and gas and substitute these fossil fuels with clean energy sources.

The GHG mitigation during the lifespans of street trees can efficiently compensate for the GHG emissions that occur during end-of-life treatment (including both incineration and composting). On average, around 40 t CO₂-eq of GHG mitigation would be achieved by planting a street tree. The cost-effectiveness analysis showed that US\$223 992 were saved over the study period due to the reduction in carbon tax achieved by the mitigation of GHGs.
