The biology of tooth movement Table 35.1 Optimal force levels for various tooth movements. Figure 35.1 (A) (i) Tipping movement results from compressive forces on diagonally opposite ends of the periodontal ligament. These are greatest at the alveolar crest and root apex and reduce to zero adjacent to the centre of resistance.

BIOLOGY OF TOOTH MOVEMENT By: Dr shabeel pn. 2.

Introduction Orthodontic tooth movement is a unique process where a solid object (tooth) is made to move through a solid medium (bone). Orthodontic treatment is possible due to the fact that whenever a prolonged force is applied on a tooth, bone remodelling occurs around the tooth resulting in its movement .

### **Biology Of Tooth Movement - SlideShare**

Orthodontic tooth movement (OTM) is facilitated by remodeling of the dental and paradental tissues which, when exposed to varying degrees of magnitude, frequency and duration of mechanical loading, express extensive physical and chemical changes that differ from the processes of physiological dental drift, or tooth eruption.

Study by Pilon et al performed on beagles, divided the curve of tooth movement into 4 phases: The first phase lasts 24 hrs to 2 days and represents the initial movement of the tooth inside its bony socket. Second phase when the tooth movement stops for 20 to 30 days. After the removal of necrotic tissue formed during the second phase , tooth movement is accelerated in the third phase and continues into the fourth linear phase.

### **Biological mechanisms of tooth movement | Wiley Online Books**

The physical behavior of tooth movement due to orthodontic force relies on Newton's Laws. The tooth biological system reacts to variation in force magnitude, time of application and directionality through receptor cells and signaling cascades that ultimately produce bone remodeling and orthodontic tooth movement (OTM).

### **Orthodontic tooth movement: The biology and clinical ...**

The orthodontic force applied on the tooth structure results in a tooth movement by deposition and resorption of alveolar bone called as remodeling. This force is converted into biological

activity, although this activity is not fully understood but three possible theories of tooth movement are advocated.
