Effect of Using Multiple Representations on Student Success in Solving Rational, Radical, and Absolute Value Equations and Inequalities

Because of an emerging body of research and a wealth of classroom experiences, the National Council of Teachers of Mathematics adopted representation as a process standard in 2000 to add to the four previously adopted (1989) process standards - problem solving, reasoning and proof, connections, and communication. The purpose of this study was to determine the effect of using multiple representations on learning to solve equations at the grade 11 level. The sources of data included three unit test scores for two different groups over a seven-week period prior to the treatment and a test score for the two groups after the treatment. Because of small class sizes (23 and 26), the statistical results need to be verified in future studies with larger groups. However, the results of this study indicate that students benefit from a multi-representational approach to equation solving. Students in the experimental group chose the graphing method of solving equations more often than the algebraic method and had more success with graphing compared to the algebraic approach. However, on some questions, students in the experimental group scored lower with the graphical method than the algebraic method. These results indicate that teachers need to weigh the benefits of teaching mathematical concepts with more than one representation against the costs of the learning demands placed on the student.

Context-based Instruction

A Study on Learning, Retention, and Affective Measures

This study examined how context-based instruction affects students' understanding, application, retention and motivation to learn absolute value, inequalities, and absolute value inequalities. The participants (N = 33) were enrolled in an intermediate algebra course at a university in southwest Missouri and were grouped into a control (N = 17) and treatment group (N = 16). The participants completed a math pre-test, post-test and cumulative test. The control and treatment groups also completed a pre-test and post-test questionnaire to investigate how context-based instruction impacted affective measures. The study was unable to prove that context-based instruction significantly improved student learning or retention of solving linear inequalities, linear absolute value equations and absolute value inequalities. However, the study did show that context-based instruction significantly improved students' ability to apply linear inequalities and absolute value equations to real life situations when compared to process-based instruction. The pre-test and post-test questionnaires covering affective measures showed there was no significant difference in student attitude or confidence over inequalities or absolute values between the treatment and the control group. The questionnaires for this study also indicated no significant difference while looking at the confidence of students to solve absolute value inequalities. The study did show that using context-based instruction increased students' interest in absolute value inequalities, while using process-based instruction had no change on students' interest on absolute value inequalities.

Elementary Differential Equations and Boundary Value Problems *John Wiley & Sons*

This revision of the market-leading book maintains its classic strengths: contemporary approach, flexible chapter construction, clear exposition, and outstanding problems. Like its predecessors, this revision is written from the viewpoint of the applied mathematician, focusing both on the theory and the practical applications of Differential Equations as they apply to engineering and the sciences. Sound and Accurate Exposition of Theory--special attention is made to methods of solution, analysis, and approximation. Use of technology, illustrations, and problem sets help readers develop an intuitive understanding of the material. Historical footnotes trace development of the discipline and identify outstanding individual contributions.

College Algebra

Building Concepts and Connections *Cengage Learning*

Based on years of experience teaching and writing supplemental materials for more traditional precalculus books, Reva Narasimhan takes a functions-focused approach to teaching and learning algebra and trigonometry concepts. This new series builds up relevant concepts using functions as a unifying theme, repeating and expanding on connections to basic functions. Visualization and analysis motivate the functions-based approach, enabling users to better retain the material for use in later calculus courses.

EBOOK: College Algebra with Trigonometry *McGraw Hill*

Barnett, Ziegler, Byleen, and Sobacki's College Algebra with Trigonometry text is designed to be user friendly and to maximize student comprehension by emphasizing computational skills, ideas, and problem solving as opposed to mathematical theory. The large number of pedagogical devices employed in this text will guide a student through the course. Integrated throughout the text, students and instructors will find Explore-Discuss boxes which encourage students to think critically about mathematical concepts. In each section, the worked examples are followed by matched problems that reinforce the concept being taught. In addition, the text contains an abundance of exercises and applications that will convince students that math is useful. A MathZone site featuring algorithmic exercises, videos, and other resources accompanies the text.
