The M/M/1 queue and its extensions to more general birth-death processes are analyzed in detail, as are queues with phase-type arrival and service processes. The M/G/1 and G/M/1 queues are solved using embedded Markov chains; the busy period, residual service time, and priority scheduling are treated. Open and closed queueing networks are analyzed.

Numerous queueing models use continuous-time Markov chains. For example, an M/M/1 queue is a CTMC on the non-negative integers where upward transitions from i to $i + 1$ occur at rate λ according to a Poisson process and describe job arrivals, while transitions from i to $i - 1$ (for $i > 1$) occur at rate μ (job service times are exponentially distributed) and describe completed services (departures) from the queue.
