 lentivirus. Lentivirus
 are a family of viruses

 Many such viruses

have been the basis of research using viruses in gene therapy, but the lentivirus is unique in its ability to infect non-dividing cells, and therefore has a wider range of potential applications. Lentiv

Lentiviral vector systems for constitutive gene expression

Recently, progress has been made in the development of vectors based on the lentivirus genus of retroviruses, which ironically includes a major human

pathogen, human immunodeficiency virus (HIV). As these vector systems for clinical gene transfer are developed, it is important to understand the rationale behind their design and development.

Development of lentiviral vectors for gene therapy for ...

The lentiviral vector system is a highly efficient vehicle for introducing genes permanently into mammalian cells. Presently, it is one of the two most commonly used methods for gene delivery into mammalian cells (the other being conventional plasmid transfection).

Lentiviral transduction is one of the most effective delivery system for stable gene expression. Unlike the retroviral system, the lentiviral integration is cell cycle independent. The genetic materials encoded by the lentivirus can be efficiently delivered

into both dividing and nondividing cells.

Lentiviral Vectors for Gene Expression - Biosettia

The *Drosophila melanogaster* ecdysone receptor (EcR)-based gene regulatable system has been adapted to lentiviral vectors (Galimi et al., 2005). EcR is a member of the nuclear receptor superfamily that mediates a cascade of morphological changes in *Drosophila*, triggered by the steroid hormone ecdysone.

In terms of vector design, 2nd and 3rd generation lentiviral systems provided by Addgene separate transfer, envelope, and packaging components of the virus onto different vectors. The transfer vector encodes the gene of interest and contains the sequences that will incorporate into the host cell genome, but

cannot produce functional viral particles without the genes encoded in the envelope and packaging vectors.

Addgene: Lentiviral Guide

This vector is built using a lentivirus (e.g. HIV; most well characterized lentivirus) as the blueprint. The HIV genome is made up of 9 genes and every single gene is required to cause disease. To make the vector, scientists select 3 or 4 different genes from the blueprint of the viral genome.

Viral and Non-Viral Vectors| Lentiviral, Adenoviral & AAV

Lentiviral Vector. The development of safe and efficient gene delivery systems helps

to develop effective clinical protocols. Lentiviruses, which belong to a subgroup of retrovirus family, have the ability to infect proliferating and quiescent cells. Vector systems based on the human immunodeficiency virus (HIV) or other lentiviruses have the potential to be important tools for clinical gene therapy.

Lentiviral Vector - Creative Biolabs

Main article: Lentiviral vector in gene therapy
Lentivirus is primarily a research tool used to introduce a gene product into in vitro systems or animal models. Large-scale collaborative efforts are underway to use lentiviruses to block the expression of a specific gene using

RNA interference technology in high-throughput formats.

Lentivirus - Wikipedia

The Lenti-X Tet-One Inducible Expression System is a tetracycline-inducible lentiviral gene expression system that allows you to produce high titers of recombinant, VSV-G-pseudotyped lentiviruses for the purpose of establishing a tightly inducible expression system for your gene of interest in a wide variety of dividing and non-dividing mammalian cells.

Lentiviral Tet-One inducible expression systems

In one of the early gene therapy trials in 1999 this led to the

death of Jesse Gelsinger, who was treated using an adenoviral vector. [2] Some viral vectors, for instance gamma-retroviruses, insert their genomes at a seemingly random location on one of the host chromosomes, which can disturb the function of cellular genes and lead to cancer.

Lentiviral vectors to unlock its potential CRISPR/cas9 system can knock-out genes of interest through the NHEJ pathway, or knock-out, knock-in or tag genes by homologous

recombination.

CRISPR/Cas9 is a very powerful tool and has to be delivered with the suitable efficiency to take full advantage of its potential.

CRISPR-Cas9 Lentivirus Vectors - GEG Tech

Lentiviruses can deliver a significant amount of genetic information into the DNA of the host cell, so they are one of the most efficient methods of a gene delivery vector. HIV, SIV, and FIV are all examples of lentiviruses.
