Set Theory and Logic

There is a natural relationship between sets and logic. If A is a set, then $P(x) = \{x \in A\}$ is a formula. It is true for elements of A and false for elements outside of A . Conversely, if we are given a formula $Q(x)$, we can form the truth set consisting of all x that make $Q(x)$ true. This is usually written $\{x: Q(x)\}$ or $\{x \mid Q(x)\}$.

A set is completely determined by the elements and we define equality on sets as follows: Definition 2. Let A and B be sets. Then $A = B$ iff they contain exactly the same elements, that is $\forall a (a \in A \leftrightarrow a \in B)$. To prove that two sets A and B are equal, we need to show that for all $a \in A$ we have $a \in B$ and for all $a \in B$, we have $a \in A$. Claim 3. Let A and B be sets.

In set theory, Zermelo–Fraenkel set theory, named after mathematicians Ernst Zermelo and Abraham Fraenkel, is an axiomatic system that was proposed in the early twentieth century in order to formulate a theory of sets free of paradoxes such as Russell's paradox. Today, Zermelo–Fraenkel set theory, with the historically controversial axiom of choice (AC) included, is the standard form of axiomatic set theory and as such is the most common foundation of mathematics.
