The pathophysiology of sepsis can be regarded as a series of steps, beginning with the invasion of normally sterile tissue by microbes and the elaboration of various pro-inflammatory mediators. The final common pathway is often the development of the multiple organ dysfunction syndrome (MODS).

Mechanisms of Organ Dysfunction in Critical Illness ...

Organ dysfunction in sepsis involves multiple mechanisms, including endothelial and microvascular dysfunction, immune and autonomic dysregulation, and cellular metabolic reprogramming. Both adaptive and pathogenic responses result in decreased organ function; the clinical phenotype involves a mixture of these responses in a complex, time-dependent way.

Mechanisms of Organ Dysfunction in Critical Illness

The mechanism of cell death in this syndrome is poorly understood. Lipopolysaccharide (LPS) is a commonly implicated PAMP in ACLF that signals mainly via the Toll-like receptor 4 (TLR4) pathway. Following TLR4/LPS interaction, there is a release of pro-inflammatory cytokines and DAMPs such as extracellular adenosine triphosphate (ATP) which, signals via the P2X7 receptor pathway.

Sepsis-associated organ dysfunction involves multiple responses to inflammation, including endothelial and microvascular dysfunction, immune and autonomic dysregulation, and cellular metabolic reprogramming. The effect of targeting these mechanistic pathways on short- and long-term outcomes depends highly on the timing of therapeutic intervention.

Mechanisms of Organ Dysfunction in Sepsis.

The effects of impaired cellular function, including mitochondrial dysfunction and altered cell death mechanisms, on the development of organ dysfunction are also being unravelled. Insights have been gained into interactions between key organs (such as the kidneys and the gut) and organ-organ crosstalk during sepsis.

Mechanisms and Treatment of Organ Failure in Sepsis

Abstract. Intestinal barrier dysfunction is thought to contribute to the development of multiple organ dysfunction syndrome in sepsis. Although there are similarities in clinical course following sepsis, there are significant differences in the host response depending on the initiating organism and time course of the disease, and pathways of gut injury vary widely in different preclinical models of sepsis.

The pathophysiology of sepsis can be regarded as a series of steps, beginning with the invasion of normally sterile tissue by microbes and the elaboration of various pro-inflammatory mediators. The final common pathway is often the development of the multiple organ dysfunction syndrome (MODS). Whereas a great deal has been learned during the past quarter century about the inflammatory ...

Mechanisms of Organ Dysfunction in Critical Illness ...

The underlying mechanisms include down-regulation of beta-adrenergic receptors, depressed postreceptor signaling pathways, impaired calcium liberation from the sarcoplasmic reticulum, and impaired electromechanical coupling at the myofibrillar level. Most, if not all, of these changes are

regulated by cytokines and nitric oxide.

Mechanisms of sepsis-induced cardiac dysfunction

Oxidative stress, as well as pro-inflammatory cytokines, initiate vascular endothelial dysfunction and, in consequence, impair microcirculation. Microcirculation damage leads to adaptive modifications of cell metabolism. Moreover, mitochondrial dysfunction takes place which results in increased apoptosis and organ damage.

The primary cause triggers an uncontrolled inflammatory response. Sepsis is the most common cause of Multiple Organ Dysfunction Syndrome and may result in septic shock. In the absence of infection, a sepsis-like disorder is termed systemic inflammatory response syndrome (SIRS).

This syndrome has been called the multiple organ dysfunction syndrome (MODS). The organs most commonly affected are the lungs, liver, and kidneys. 50 Clinically, manifestations of MODS include arterial hypoxemia (pulmonary dysfunction), cholestatic jaundice (hepatic dysfunction), and azotemia (renal dysfunction). Although a fatal outcome in patients with sepsis and septic shock is virtually always accompanied by MODS, the histopathology of fatal sepsis is remarkably bland.

Wall et al. characterized the mechanisms underlying post-traumatic cardiac dysfunction in mice undergoing soft tissue trauma and bone fracture followed by hemorrhage. Despite resuscitation, stroke volume remained at 25% of baseline values, which was associated with leukocyte infiltration and ultrastructural sarcomere and mitochondriadisorganization, leading to increased serum levels of heart fatty acid-binding protein and troponin I.
