In these lessons, we will learn how to perform matrix multiplication. We will illustrate matrix multiplication or matrix product by the following example. Example: Find $C = A \times B$. Solution: Step 1 : Multiply the elements in the first row of A with the corresponding elements in the first column of B. Add the products to get the element C 11

$z + 3b = 1$. This is a system consisting of two variables and two parameters. We then solve the equations for the basic variables, x and z: $x = 2 + 2a$ $2b$ $z = 1 - 3b$. Remember that $y = a$ and $w = b$, so we have: $x = 2 + 2a$ $2b$ $y = a$ $z = 1 - 3b$ $w = b$. Note: In your Linear Algebra class (Math 254 at Mesa), you may want to line up like terms.

Problems and Solutions in Matrix Calculus

The whole point of matrices is that we can use them to solve systems that have many equations. So rather than solving one by one, there are operations that quickly reduce a system of equations that are in matrix form into a solution. You will be getting to this soon! (1 vote)

There are problems at the end of each lecture chapter and I have tried to choose problems that exemplify the main idea of the lecture. Students taking a formal university course in matrix or linear algebra will usually be assigned many more additional problems, but here I follow the philosophy that less is more.
