We propose a novel design of internal impedance matching networks for axial-mode helical antennas. This network comprises a single wire attached to the helix. One of the main challenges when designing an internal matching network is its strong electromagnetic coupling with the antenna. The matching network must hence be designed in the presence of the antenna, which slows down the design process.

In telecommunication, a microstrip antenna usually means an antenna fabricated using photolithographic techniques on a printed circuit board. It is a kind of internal antenna. They are mostly used at microwave frequencies. An individual microstrip antenna consists of a patch of metal foil of various shapes on the surface of a PCB, with a metal foil ground plane on the other side of the board. Most microstrip antennas consist of multiple patches in a two-dimensional array. The antenna is usually

A microstrip or patch antenna is a low profile antenna that has a number of advantages over other antennas. Microstrip antenna found application in different fields due to its compact size. Akin to the two sides of a coin, a patch antenna also has some drawbacks. Bandwidth and gain being the two most important factors of an antenna is low for patch antennas. There are many ways to solve this problem but each of them leads to another problem which requires
