FastVDMA is an open source DMA (Direct Memory Access) controller developed at Antmicro. One of the main motivations leading to the design of an open source DMA controller was the lack of portable open source alternatives to proprietary controllers provided by FPGA vendors. This situation leads to a reduction in the reusability of DMA-based designs into different contexts when adopting multiple kinds of platforms, since DMA solutions tend to be tightly integrated with vendor-specific ...

Overview. The DMA controller is designed for data transfer in different system environments. Two module types : type 0 and type 1 are provided, and the user can choose the number of each module type. Type 0 modules are designed to transfer data residing on the same bus, and Type 1 modules are designed to transfer data between two different buses. Each module can support up to 4 DMA channels and the IP supports up to 16 total DMA channels.
