The linear theory of stability is unable to give a correct answer since its analysis is limited to first-order terms and its results are not significant when exp(wt) becomes significant. A correct answer is given by the bifurcation theory. The correct solution obtained by numerical integration shows that the system tends towards a limit cycle i.e. to Prigogine's dissipative structure.

Bifurcation theory is the mathematical study of changes in the qualitative or topological structure of a given family, such as the integral curves of a family of vector fields, and the solutions of a family of differential equations. Most commonly applied to the mathematical study of dynamical systems, a bifurcation occurs when a small smooth change made to the parameter values of a system causes a sudden 'qualitative' or topological change in its behavior. Bifurcations occur in both continuous
