Experiment 7: RC Circuits

In the RC circuit, we have a voltage source in series with a resistor instead of a current source. When the 5 V is initially applied to the circuit, it all appears across the resistor because the initially zero voltage across the capacitor cannot change instantaneously (unless, of course, we had an infinite current

available). In the first circuit the 5V across the resistor produces a current of 5V/100K amps by Ohm's law, which begins to charge the capacitor.

Introduction to RC Circuits [Analog Devices Wiki]

An RC circuit is composed of at least one resistor and at least one capacitor. A capacitor is composed of two plates with either air or an insulator also known as a dielectric between the plates. We do not want the plates to be touching, because then we would only have a conductor.

Introduction to the Oscilloscope and RC Circuits

A resistor-capacitor circuit (RC circuit), or RC filter or RC network, is an electric circuit composed of resistors and capacitors. It may be driven by a voltage or current source and these will produce different responses. A first order RC circuit is composed of one resistor and one capacitor and is the simplest type of RC circuit.

Series RC circuit. From Kirchhoff's laws, it can be shown that the charging voltage $V_c(t)$ across the capacitor is given by: $V_c(t) = V(1 - e^{-t/RC})$, $t \geq 0$. where V is the applied source voltage to the circuit for $t = 0$, and $RC = \tau$ is the time constant. The transient response curve of RC circuit increases and is shown in Figure 3. Figure 3.
