The Web Audio API is built around the concept of an audio context. The audio context is a directed graph of audio nodes that defines how the audio stream flows from its source (often an audio file) to its destination (often your speakers). As audio passes through each node, its properties can be modified or inspected.

`var freqDomain = new Float32Array(analyser.frequencyBinCount);`
`analyser.getFloatFrequencyData(freqDomain);` In the previous example, `freqDomain` is an array of 32-bit floats corresponding to the frequency domain. These values are normalized to be between zero and one. The indexes of the output can be mapped linearly between zero and the nyquist

frequency, which is defined to be half of the sampling rate (available in the Web Audio API via `context.sampleRate`).

I wrote a short book about the Web Audio API. The book is meant as an introduction to the web audio API, as well as some audio basics for web developers with little audio experience. It is available for free on Chimera , a web-based book viewer, which presents a nicely laid out page and lets you leave per-paragraph comments. The online version also includes inline samples from webaudioapi.com .
