Law Of Universal Gravitation Additional

The Law of Universal Gravitation states that every point mass attracts every other point mass in the universe by a force pointing in a straight line between the centers-of-mass of both points, and this force is proportional to the masses of the objects and inversely proportional to their separation. This attractive force always points inward, from one point to the other.

Newton's law of gravitation, statement that any particle of matter in the universe attracts any other with a force varying directly as the product of the masses and inversely as the square of the distance between them. In symbols, the magnitude of the attractive force F is equal to G (the gravitational constant, a number the size of which depends on the system of units used and which is a universal constant) multiplied by the product of the masses (m_1 and m_2) and divided by the square of ...

Newton's law of universal gravitation is usually stated as that every particle attracts every other particle in the universe with a force that is directly proportional to the product of their masses and inversely proportional to the square of the distance between their centers. The publication of the theory has become known as the "first great unification", as it marked the unification of the ...

G is called the universal gravitation constant and the units of G are such that the m^2 in the denominator on the right hand side cancel out, the kg^2 in the numerator cancel, and the result should be a force in Newtons. This force is thought to apply to any two masses whether two planets or an apple and the Earth so the law is called Universal.

The gravitational force between any two bodies having some mass can be determined from Newton's law of gravitation. The force of attraction between bodies is directly proportional to the product of their masses and inversely proportional to the square of the distance between them. $F = G \frac{m_1 m_2}{r^2}$ m . Here, G is called the universal gravitational constant.
