In this paper, which is a continuation of the discrete-time paper (Björk and Murgoci in *Finance Stoch.* 18:545-592, 2004), we study a class of continuous-time stochastic control problems which, in various ways, are time-inconsistent in the sense that they do not admit a Bellman optimality principle. We study these problems within a game-theoretic framework, and we look for Nash subgame perfect equilibrium points.

Stochastic control or stochastic optimal control is a sub field of control theory that deals with the existence of uncertainty either in observations or in the noise that drives the evolution of the system. The system designer assumes, in a Bayesian probability-driven fashion, that random noise with known probability distribution affects the evolution and observation of the state variables. Stochastic control aims to design the time path of the controlled variables that performs the desired control.

Abstract. This paper studies a class of continuous-time scalar-state stochastic Linear-Quadratic (LQ) optimal control problems with the linear control constraints. Using the state separation theorem induced from its special structure, we derive the analytical solution for this class of problems. The revealed optimal control policy is a piece-wise affine function of system state.

More precisely, a real-valued continuous-time stochastic process with a probability space $(\Omega, \mathcal{F}, \mathbb{P})$ is separable if its index set has a dense countable subset C and there is a set C' of probability zero, so that $C \cap C' = \emptyset$, such that for every open set U and every closed set $F = (-\infty, \infty)$,

the two events $\{\epsilon \in \mathcal{N}\}$ and $\{\epsilon \in \mathcal{E}\}$ differ from each other at most on a subset of $\mathcal{N}$.
