Original image of a logistic curve, contrasted with a logarithmic curve. The logistic function was introduced in a series of three papers by Pierre François Verhulst between 1838 and 1847, who devised it as a model of population growth by adjusting the exponential growth model, under the guidance of Adolphe Quetelet. Verhulst first devised the function in the mid 1830s, publishing a brief ...

When resources are unlimited, populations exhibit (a) exponential growth, shown in a J-shaped curve. When resources are limited, populations exhibit (b) logistic growth. In logistic growth, population expansion decreases as resources become scarce, and it levels off when the carrying capacity of the environment is

reached.

Exponential And Logistic Growth Curves Answers

Logistic growth starts off nearly exponential, and then slows as it reaches the maximum possible population. The logistic model is defined by a linear decrease of the relative growth rate. At any given time, the growth rate is proportional to $Y(1 - Y/Y_M)$, where Y is the current population size and Y_M is the

maximum possible size.
