Trihedral Corner Reflector Antennas | Reflector Antenna Design

Corner reflectors are used to generate a particularly strong radar echo from objects that would otherwise have only very low effective Radar cross section (RCS). A corner reflector consisting of two or three electrically conductive surfaces which are mounted crosswise (at an angle of exactly 90 degrees). Incoming electromagnetic waves are backscattered by multiple reflection accurately in that direction from which they come. Thus, even small objects with small RCS yield a sufficiently strong ...

Trihedral Reflectors for Radar Applications

Corner reflectors (CRs) are installed on sites to reflect radar signals back to the satellite at specific locations. They do not require a power source or any maintenance post-installation and are used to: Acquire displacement measurements over areas that are densely vegetated or covered by snow; Monitor specific locations within your area of interest

The corner reflector is then welded together symmetrically from these seven parts. This self-built corner reflector with an edge length of the square sheets of 0,5 m then has got in the I/J-band an effective radar cross-section of far more than the five hundred times the value that would have a small rowing boat without this angle reflector. In inland navigation this small rowing boat is then a no longer be overlooked target mark on the radar screen!

corner reflectors - Radartutorial

When a linearly polarized radar source is used, it is desirable that the reflector reflect a cross-polarized signal back to the radar unit when the radar has a cross-polarized channel. One method of increasing the reflected energy from a corner reflector, by causing the incident linearly polarized beam to be reflected in a cross polarized manner, is disclosed in U.S. Pat. No. 3,309,705.
