Capacitive Sensors Capsense

Capacitive Sensors sense many different variables by measuring capacitance. Variables like motion, humidity, acceleration, position, proximity, fluid level, and material composition.

All you need to know about capacitive sensors

Capacitive sensors can directly sense a variety of things—motion, chemical composition, electric field—and, indirectly, sense many other variables which can be converted into motion or dielectric constant, such as pressure, acceleration, fluid level, and fluid composition.

In electrical engineering, capacitive sensing (sometimes capacitance sensing) is a technology, based on capacitive coupling, that can detect and measure anything that is conductive or has a dielectric different from air.

Capacitive sensing - Wikipedia

A capacitive sensor is a proximity sensor that detects nearby objects by their effect on the electrical field created by the sensor. Simple capacitive sensors have been commercially available for many years, and have found a niche in nonmetallic object detection, but are limited to short ranges, typically less than 1 cm. Capacitive sensors have some similarities to radar in their ability to detect conductive materials, while seeing through insulating materials such as wood or plastic.

Capacitive Sensor Introduction

A capacitive sensor works in the same way as a capacitor. The sensor itself is only a conductive surface and will start working as a capacitor by the proximity of any other conductive surface, for example by skin (as long as it has a relative negative charge).

Capacitive Sensing for Dummies : 7 Steps - Instructables

The capacitiveSensor library turns two or more Arduino pins into a capacitive sensor, which can sense the electrical capacitance of the human body. All the sensor setup requires is a medium to high value resistor and a piece of wire and a small (to large) piece of aluminum foil on the end. At its most sensitive, the sensor will start to sense a hand or body inches away from the sensor. Downloads

CapacitiveSensor - Arduino Libraries

Capacitive touch sensing is a way of human touch sensing, that requires little or no force to activate. It may be used to sense human touch through more than a quarter of an inch of plastic, wood, ceramic or other insulating material (not any kind of metal though), enabling the sensor to be completely visually concealed.

The total parasitic capacitance of the sensor should not exceed 2-pF for better sensitivity. Please go through the Manual tuning section PSoC 4 and 6 CapSense design guide. Please note that you have tune the sensors in such a way that when the metal ball is placed on the sensor, the raw counts would go up by 5 times than the rawcounts caused by noise.
