Chemical Vapor Deposition for Solvent-Free Polymerization ...

In chemical vapor deposition (CVD) polymerization, vapor-phase monomers react to form pure solid films directly on the surface of a substrate. Thus, polymerization and coating occur in a single processing step. This enables the formation of highly cross-linked coatings as well as copolymers of incompatible monomers.

Designing polymer surfaces via vapor deposition ...

Chemical vapor deposition is a vacuum deposition method used to produce high quality, high-performance, solid materials. The process is often used in the semiconductor industry to produce thin films. In typical CVD, the wafer is exposed to one or more volatile precursors, which react and/or decompose on the substrate surface to produce the desired deposit. Frequently, volatile by-products are also produced, which are removed by gas flow through the reaction chamber. Microfabrication processes wi

Chemical Vapor Deposition Polymerization: The Growth and ...

In Initiated Chemical Vapor Deposition (iCVD), monomer and initiator flow into a vacuum chamber where they contact resistively heated filaments.

The initiator breaks down into radicals, beginning a free-radical polymerization of the monomer at the substrate surface.

Fabrication of high-quality CPs thin film in a large scale is of high demand in multiple industrial sectors. Chemical vapor deposition (CVD) is a promising approach for scale-up and commercialization of CPs in large-scale thin film applications by a roll-to-roll process.

This article focuses on a vapor deposition polymerization (VDP) polyimide as a TSV liner dielectric. The polyimide preparation by VDP has been developed in the middle of 1980's. [21, 22] However, the VDP polyimides have not been industrially employed in microelectronics applications. This is probably because the VDP is not cost-effective, compared with well-known spin-on polyimides widely used as passivation/buffer layers in microelectronic industry.

In response to this challenge, this work reports on chemical vapor deposition (CVD) polymerization of poly(p-xylylene) (PPX) layers at controlled substrate temperatures (14–16 °C) for efficient surface passivation of perovskite thin films.
