Worksheet #5 Factoring: Special Patterns

Both 25 and 30 are divisible by 5, but 9 isn't divisible by 5. We could factor this by grouping. But if we look a little bit more carefully here, see something interesting. 25 is a perfect square, and $25x^2$ squared is a perfect square. It's the square of $5x$. And then nine is also a perfect square.

Both of our terms pass this test as well. If this trinomial turns out to be a perfect square trinomial, $2x$ will be our a and 5 will be our b from the formulas for factoring a perfect square trinomial.

Factoring Perfect Square Trinomials Practice Problems ...

Factoring a Perfect Square Trinomial A perfect square trinomial is a trinomial that can be written as the square of a binomial. Recall that

when a binomial is squared, the result is the square of the first term added to twice the product of the two terms and the square of the last term. $a^2 + 2ab + b^2 = (a + b)^2$ and $a^2 - 2ab + b^2 = (a - b)^2$

Factoring perfect square trinomials (article) | Khan Academy

The first term and the last term are perfect squares. The coefficient of the middle term is twice the square root of the

last term multiplied by the square root of the coefficient of the first term. When we factor a perfect square trinomial, we will get. $(ax)^2 + 2abx + b^2 = (ax + b)^2$

Trinomial This is a special case where the first and last terms of the trinomial are perfect squares and the middle term is twice the product of the square roots of those respective squares. Watch the signs: a minus before the second term in the trinomial means a minus in the binomial that is squared.
