Follow these steps to get the response (output) of the second order system in the time domain. Take Laplace transform of the input signal, $r(t)$. Consider the equation, $C(s) = (\omega_n^2 s^2 + 2\delta\omega_n s + \omega_n^2) R(s)$ Substitute $R(s)$ value in the above equation. Do partial fractions of $C(s)$ if required.

Response of Second Order System - Tutorialspoint

The second-order system is unique in this context, because its characteristic equation may have complex conjugate roots. The second-order system is the lowest-order system capable of an oscillatory response to a step input. Typical examples are the spring-mass-damper system and the electronic RLC circuit. Second-order systems with potential oscillatory responses require two different and independent types of energy storage, such as the inductor and the capacitor in RLC filters, or a spring ...

Abstract: The purpose of this lab was to use the concept of transfer functions in order to characterize a second order system. The experiment encompassed analyzing a forced response system that was modeled by a pendulum attached to a motor, and a free decay system modeled by just the pendulum. The data was analyzed and processed through MATLAB by which we created a transfer function for both ...

Time-domain response of a second order circuit consists of two parts - natural response and forced response. The forced response for a step function input is the step function itself, while the natural response depends only on the circuit elements and decays for time $t \rightarrow \infty$.

The time response expression of a second order control system subject to unit step input function is given below. The reciprocal of constant of negative power of exponential term in the error part of the output signal is actually responsible for damping of the output response.
