Regret Minimization Algorithms And Applications

Regret is the de-facto standard in measuring performance of learning algorithms. 1 Intuitively, an algorithm performs well if its regret is sublinear as a function of T , i.e. $\text{Regret } T(A) = o(T)$, since this implies that “on the average” the algorithm performs as well as the best fixed strategy in hindsight.

The convex optimization approach to regret minimization

Such a relationship opens a door to a decomposition scheme, called progressive hedging, for solving multistage risk minimization and regret minimization problems. In particular, the classical progressive hedging algorithm is modified in order to handle a new class of linkage constraints that arises from reformulations and other applications of risk and regret minimization problems.

The regret minimization rule performs regret minimization between stock and cash. It is defined by

the update equations $w_{s,t+1} = w_{s,t} f(r_t)$, and $w_{c,t+1} = w_{c,t}$, where $f : \mathbb{R}^+ \rightarrow \mathbb{R}^+$. In what follows, we use $f(r_t) = 1 + \eta r_t$, which is the regret minimization rule of the Polynomial Weights algorithm [25], as adapted in [35].

Abstract In recent years convex optimization and the notion of regret minimization in games have been combined and applied to machine learning in a general framework called online convex optimization. We will survey the basics of this framework, its applications, main algorithmic techniques and future research directions.

As a result, regret minimizing algorithms in self-play can be used as a technique for computing an approximate Nash equilibrium. Moreover, an algorithm's bounds on the average overall regret bounds the rate of convergence of the approximation. Traditionally, regret minimization has focused on bandit problems more akin to normal-form games.

Learning, Regret minimization, and Equilibria

In regret-minimization algorithms, a strategy is determined through an iterative process. While there are a number of such algorithms (e.g., (Greenwald, Li, and Marks 2006; Gordon 2007)), this paper will focus on a typical one called regret matching (specifically, the polynomially weighted average forecaster with polynomial degree 2).
