Geometric Algebra For Computer Science

Geometric algebra is a consistent

computational framework for geometric programming. It has new, geometrically meaningful products to calculate directly with the subspaces of a vector space. This capability considerably reinforces and extends the linear algebra techniques traditionally used in computer graphics and robotics.

Geometric Algebra For Computer Science

Geometric Algebra for Computer Science (Revised Edition) presents a compelling alternative to the limitations of linear algebra. Geometric algebra (GA) is a compact, time-effective, and performance-enhancing way to represent the geometry of 3D objects in computer programs. This book explains GA as a natural extension of linear

algebra and conveys its significance for 3D programming of geometry in graphics, vision, and robotics.

We have found a new way to factor blades that also helps to speed up computing the join of blades. Computing the join of blades is now 10x faster than the algorithms presented in the book (as benchmarked in Section 5.11.2).

Geometric Algebra For Computer Science

In geometric algebra, you can use a unit

vector a as a reflection operator by employing it in a sandwiching product: $a x a$ reflects the vector x in the line of a . It then follows from the figure that the geometric product of two unit vectors $R = b a$ fully encodes the rotation as a double reflection.

Almost all chapters of the book contain drills, structural exercises and programming exercises. When we wrote the drills and exercises for Geometric Algebra for Computer Science, we intended them to be for self-study. As such, we are tempted to release solutions to all the drills and structural exercises.

Using geometric algebra, any k -dimensional linear subspace can be represented as a computational element called a blade, and you won't need the lookup tables anymore because equations will become intuitive, simple

and generic. In geometric algebra, blades are constructed using the outer product (denoted $\wedge$).

Such extended geometrical entities are now basic elements of algebraic computation. We use the blades of a geometric algebra to algebraically represent all geometrical primitives. The scalars in a vector space are represented as 0-blades, the vectors by 1-blades, and the oriented area elements are 2-blades.
