The posterior also needs enough amount of bone to make prosthesis of the appropriate size and with desirable implant-crown ratio. Therefore, alveolar ridge augmentation has become a common surgery option when

implant is placed in a defective area of the alveolar bone, and many methods and materials for this operation have been studied¹⁻⁴. For restoration in case of bone defect, autogenous bone is known as the material with the most excellent osteogenetic effect and is biocompatible.

MATERIALS AND METHODS: This study targeted patients who had vertical or horizontal ridge augmentation using AutoBT from March 2009 to April 2010. We evaluated the age and gender of the subject patients, implant stability, adjunctive surgery, additional bone graft material and barrier membrane, post-operative complication, implant survival rate, and crestal bone loss.
