The C57BL/6 inbred strain was developed starting in 1921 by Clarence Little at the Jackson Labs. At that time, a "black subline" (C57BL) and a "brown subline" (C57BR) were established and bred independently. The C57BL subline was further separated into two sublines designated "subline 6" and "subline 10."

It is the most widely used "genetic background" for genetically modified mice for use as models of human disease. They are the most widely used and best-selling mouse strain, due to the availability of congenic strains, easy breeding, and robustness.

### C57BL/6 - Wikipedia

The C57BL/6 mouse (1921) Despite its obvious limitations in mimicking everything that goes on within the human body, the laboratory mouse has proven to be an invaluable model of the human condition. Perhaps no strain of mouse exemplifies this best than a highly inbred mouse strain known as C57BL/6, sometimes abbreviated to "black 6" or B6.

C57BL/6Jrj by JANVIER LABS is a widely used strain and was the first one to have its genome sequenced. It's not very sensitive to spontaneous tumours but allows for the expression of a wide variety of mutations, hence its frequent use as genetic background in transgenic models. C57BL/6Jrj are active and easy to manipulate and have a long life expectancy.

The C57BL/6N mouse shares many characteristics with the C57BL/6J, e.g. alopecia and cannibalism. 5 SNP differences have however been identified (Petkov and Wiles, 2005). This strain does not have the deletion in the Nnt gene that has been found in the C57BL/6J.

Since C.C. Little (the founder of The Jackson Laboratory) initially generated the C57BL inbred strain in the 1920's-1930's, the inbred substrain C57BL/6 became the most frequently used mouse strain in biomedical research. The popularity of C57BL/6 inbred mice led to the establishment of many colonies at different vendors and academic institutions around the world.
