A very useful theorem in measure theory is Theorem 1. If we have two measures μ_1, μ_2 on a measurable space $(E, \mathcal{E})$ and there exists $A, \mathcal{A}$ -system generating $\mathcal{E}$ on which μ_1 and μ_2 agree then $\mu_1 = \mu_2$.

A measure m is a law which assigns a

number to certain subsets A of a given space and is a natural generalization of the following notions: 1) length of an interval, 2) area of a plane figure, 3) volume of a solid, 4) amount of mass contained in a region, 5) probability that an event from A occurs, etc.

The σ -algebra over Ω , denoted $\mathcal{E}$, called the set of events. The measure P for the measurable space $(\Omega, \mathcal{E})$ is the probability measure.

In integration theory, specifying a measure allows one to define integrals on spaces more general than subsets of Euclidean space; moreover, the integral with respect to the Lebesgue measure on Euclidean spaces is more general and has a richer theory than its

predecessor, the Riemann integral. Probability theory considers measures that assign to the whole set the size 1, and considers measurable subsets to be events whose probability is given by the measure.

If S is a set and $\mathcal{S}$ a σ -algebra of subsets of S , then the pair $(S, \mathcal{S})$ is called a measurable space. The term measurable space will make more sense in the next chapter, when we discuss positive measures (and in particular, probability measures) on such spaces. Suppose that S is a set and that $\mathcal{S}$ is a finite algebra of subsets of S .
